# STAR 3311

## CABBAGE

Type	Type A large headed hybrid cabbage variety for the fresh market. STAR 3311 has been introduced specifically for the areas where Black Rot is a serious problem.
Maturity	Early maturing. Approximately 75 - 85 days from transplant to maturity in summer. Maturity is very uniform with a high first cut percentage.
Plant Characteristics	A medium to large frame that has an upright leaf habit. A plant population of 28 000 plants per ha is recommended for single head marketing, and 35 - 45 000 plants per ha for bags. Plant population will influence head size. For larger head size the plant population should be reduced to suit your needs.
Head Characteristics	STAR 3311 has very firm flat-round shaped heads with an average head size (without frame leaves) of between 2,5 - 3,0 kg with an excellent flavour. The colour of STAR 3311 is a typical grey-green which is highly sought after by market agents and hawkers. Care should be taken not to let the crop mature past the optimal period to prevent splitting. STAR 3311 has a very high first cut percentage.
Disease Resistance	STAR 3311 has shown good field resistance to black rot.
Features and Benefits	The combination of early maturity, excellent Black Rot resistance and a vigorous seedling, contribute to the improvement in crop security that STAR 3311 offers the grower.
Fertilization Guidelines	This is a general guide, grower conditions vary and a soil analysis is highly recommended: N - 150 to 200kg/ha. 70 to 90 kg/ha incorporated preplant. Top dress the balance as follows: Summer: 7,14 and 28 days after transplanting (no later). Winter: 14,28 and 45 days from transplant (no later). P - 50 kg/ha incorporated preplant. K - 120 kg/ha incorporate preplant. Soil pH - 6 - 6,8.

### INDEMNITY

All technical advice and/or production guidelines given by STARKE AYRES or any of its personnel with reference to the use of its products, is based on the company's best judgement.
